List of Tables

1 List of softwares used . . . 11
2 List of Ac species . . . 13
3 List of Ag species . . . 17
4 List of Al species . . . 21
5 List of Am species . . . 25
6 List of As species . . . 29
7 List of Au species . . . 32
8 List of B species . . . 35
9 List of Ba species . . . 39
10 List of Be species . . . 43
11 List of Bi species . . . 46
12 List of Br species . . . 48
13 List of C species (1) . . . 50
14 List of C species (2) . . . 51
15 List of Ca species . . . 55
16 List of Cd species . . . 59
17 List of Ce species . . . 63
18 List of Cl species . . . 66
19 List of Cm species . . . 69
20 List of Co species . . . 73
21 List of Cr species . . . 77
22 List of Cs species . . . 81
23 List of Cu species . . . 85
24 List of Dy species . . . 88
25 List of Er species . . . 90
26 List of Eu species . . . 93
27 List of F species . . . 97
28 List of Fe species . . . 101
29 List of Fr species . . . 104
30 List of Ga species . . . 106
31 List of Gd species . . . 108
32 List of Ge species . . . 110
33 List of Hf species . . . 112
34 List of Hg species . . . 115
35 List of Ho species . . . 118
36 List of I species . . . 121
37 List of In species . . . 124
38 List of K species . . . 127
39 List of La species . . . 131
40 List of Li species . . . 135
41 List of Lu species . . . 138
42 List of Mg species . . . 141
43 List of Mn species . . . 145
44 List of Mo species . . . 149
45 List of N species . . . 153
46 List of Na species . . . 157
47 List of Nb species . . . 161
48 List of Nd species . . . 165
49 List of Ni species . . . 169
50 List of Np species . . . 173
51 List of Os species . . . 176

52 List of P species . . . 179
53 List of Pa species . . . 183
54 List of Pb species . . . 187
55 List of Pd species . . . 190
56 List of Pm species . . . 192
57 List of Po species . . . 194
58 List of Pr species . . . 196
59 List of Pt species . . . 198
60 List of Pu species . . . 201
61 List of Ra species . . . 205
62 List of Rb species . . . 208
63 List of Re species . . . 210
64 List of Rh species . . . 212
65 List of Ru species . . . 215
66 List of S species . . . 219
67 List of Sb species . . . 223
68 List of Sc species . . . 226
69 List of Se species . . . 229
70 List of Si species . . . 233
71 List of Sm species . . . 237
72 List of Sn species . . . 241
73 List of Sr species . . . 245
74 List of Tb species . . . 248
75 List of Tc species . . . 251
76 List of Te species . . . 254
77 List of Th species . . . 257
78 List of Tl species . . . 260
79 List of Tm species . . . 262
80 List of U species . . . 265
81 List of V species . . . 269
82 List of W species . . . 272
83 List of Y species . . . 274
84 List of Yb species . . . 276
85 List of Zn species . . . 279
86 List of Zr species . . . 283

139 Eh-pH diagrams of the system Zr-O-H (2) . . . 285

1 Introduction

This open file report aims to present an intercomparison of thermodynamic databases by means of Eh-pH diagrams, which are practical and useful for understanding geochemical behavior of elements. An Eh-pH diagram depicts the dominant aqueous species and stable solid phases on a plane defined by the Eh and pH axes. In an Eh-pH diagram, the solid stability area is related to the saturation condition, and dominant aqueous species give us fundamental information on sorption and colloid phenomena as well as surface characteristics of materials. Eh-pH diagrams are thus essential to understanding solute and radionuclide transport in groundwater.

The most well-known studies on comprehensive Eh-pH diagrams are those of Pourbaix (1966) and Brookins (1988). The former discussed corrosion, passivation and immunity of materials, while the latter reported geochemical aspects of the geological disposal of radioactive wastes. These studies have been followed by many thermodynamic databases.

With the ever increasing CPU power of computers, we have started utilizing geochemical codes for calculation of complex chemical reactions. Thus, thermodynamic databases have gained importance from a practical perspective.

Certain geochemical codes enable us to obtain Eh-pH diagrams easily and quickly. With the aid of software, Eh-pH diagrams can provide us with good insight into the state of the art in thermodynamic databases and the differences between them.

It should be noted that this open file report presents the Eh-pH diagrams calculated from databases "as is", without any critical comments. It should also be noted that Eh-pH diagrams represent one aspect of thermodynamic databases and databases are often updated, thus this report is only a snapshot of the present. I would be very pleased if this open file report proves useful in helping the readers use thermodynamic databases.

2 Databases

Let us compare the seven databases listed below. The first database is generic and popular in inorganic chemical engineering. The second and third are generic and popular in geochemistry. The fourth and fifth serve for safety assessment of geological disposal of radioactive wastes, but their coverage of chemical species is sufficiently wide to be suitable for generic use. The sixth and seventh databases mainly cover data on radioactive elements, with incomplete data on other elements. The current report presents only Eh-pH diagrams of radioactive elements included in the sixth and seventh databases.

1. FACT (FACT database) bundled with commercially available software FACTSAGE (FactSage 5.2) (Bale et al., 2002) released by GTT-Technologies.

2. SUPCRT: SUPCRT92 (Johnson et al., 1992) applied with 98 update distributed by Everette Shock from his website on the Internet.

3. Default database "thermo.dat" based on LLNL (Lawrence Livermore National Lab.) data 0.3245r46, bundled with commercially available software GWB (Geochemist's Workbench) written by C. M. Bethke, Illinois University.

4. JNC-TDB (011213g0 and 011213g2) distributed by Japan Nuclear Cycle Organization from their website (http://migrationdb.jnc.go.jp/).

5. HATCHES (ZZ-HATCHES-15) distributed by NEA (Nuclear Energy Agency) Computer Program Services.

6. Databases tabulated in OECD/NEA Chemical Thermodynamics series 1-4 (Grenthe et al., 1992; Silva et al., 1995; Rard et al., 1999; Lemire et al., 2001).

7. Databases tabulated in OECD/NEA Chemical Thermodynamics series 5 (Guillaumont et al., 2003) which is the updated version of the same series 1-4.

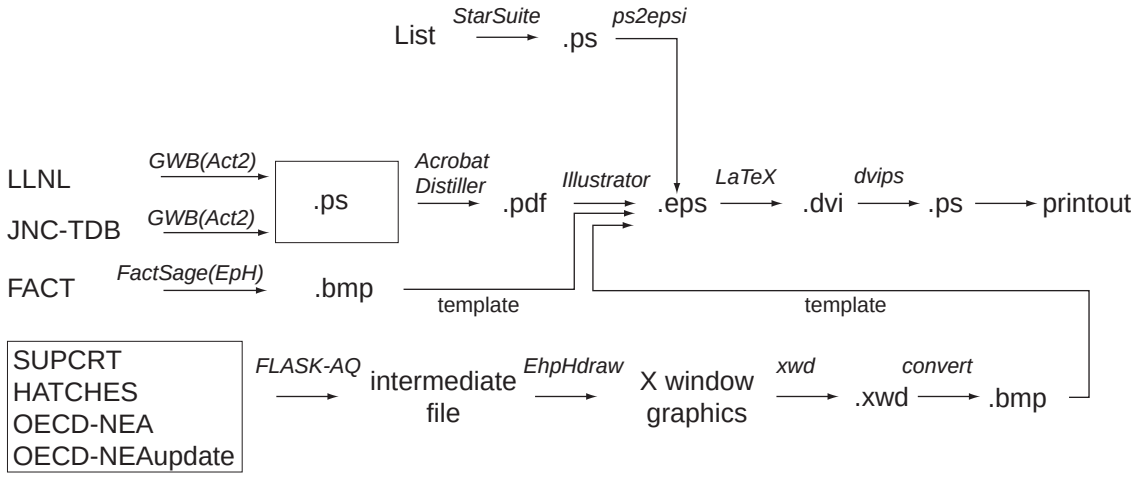

Figure 1: Flow chart of creating this report
Software is in italics. Dot name represents a file with format indicated by extention.

3 Method for constructing Eh-pH diagrams

The present report includes Eh-pH diagrams for the X-H-O system, where X = the symbol of an element like Na, K. This is the most important system for the chemical description of elements in groundwater. To understand the geochemical system of the natural barrier, we took account of not only radioactive elements, but also other elements included in the databases. However, OECD-NEA databases were excluded due to their restricted coverage of the data on non-radioactive elements. Total concentration of elements is 10^{-10} mole/kg for all diagrams. Such a low concentration enables us to safely assume the activity coefficient to be unity and impedes precipitation of the solid phases which hide the area of dominant aqueous species in the Eh-pH diagram.

To avoid unexpected errors during data conversion, databases bundled with commercially available software and databases distributed in the specific format of the software are handled with appropriate software to draw Eh-pH diagrams. Databases of the former type are FACT and LLNL, bundled with FACTSAGE and GWB, respectively. The database of the latter type is JNC-TDB, which is distributed in three formats: EQ3/6, PHREEQC, and GWB. In this report, a version in the GWB format was used. For the other databases, namely SUPCRT, HATCHES, OECD-NEA, and OECD-NEAupdate, the in-house software FLASK-AQ and its companion software EhpHdraw were used to draw the Eh-pH diagrams.

The drawing method for Eh-pH diagrams is well explained in many textbooks of chemical thermodynamics (e.g. Garrels and Christ, 1965). The algorithm for drawing Eh-pH diagrams is not documented in the commercially available software FACTSAGE and GWB.

FLASK-AQ calculates concentration of aqueous species in equilibrium and moles of stable solid (if present) on grids into which Eh and pH are divided, the Eh in 0.005 V increments from -0.8 V to 1.2 V, the pH in increments of 0.04 from 0 to 14, and outputs the dominant species and the stable solid. Companion program EhpHdraw draws Eh-pH diagrams using the output of FLASK-AQ. This method resembles that reported by Anderko et al. (1997). Unfortunately, since Anderko et al. (1997) did not describe their method in detail, I cannot compare the two methods. The accuracy of the present method for drawing boundaries between dominant species or solids depends on the grid size, which inevitably leads to errors as large as 0.0025 V and 0.02 units for Eh and pH, respectively. The following subsections describe the method for drawing Eh-pH diagrams for each database. The database name and software name (both in abbreviation) are concatenated by a slash (Figure 1).

3.1 FACT/FACTSAGE

Eh-pH diagrams are created with EpH of FACTSAGE and saved as a BMP file. This file is used as a template for the line drawing software Illustrator (Adobe Illustrator) and resized to the common axial length.

3.2 SUPCRT/FLASK-AQ

The FLASK-AQ input file was created from the output of SUPCRT92. FLASK-AQ creates an intermediate file from which EhpHdraw draws an Eh-pH diagram on the X window system. This Eh-pH diagram is captured to an X window dump file using "xwd", and then converted to a BMP file with ImageMagic. This BMP file is used as a template for Illustrator and resized to the common axial length. An enormous amount of organic species in this database are expressed stoichiometrically in terms of C, H, and O as basis species. Calculations reveal that almost all organic species are decomposed under the stability field of water under ambient conditions.

3.3 LLNL/GWB

The Eh-pH diagram is created with Act2 of GWB and is saved as a PostScript file. This file is converted to a PDF (portable document file) file with Adobe Acrobat Distiller and opened with Illustrator and resized to the common axial length.

3.4 JNC-TDB/GWB

The Eh-pH diagram is created with Act2 of GWB and saved as a PostScript file. This file is converted to a PDF file with Adobe Acrobat Distiller and opened with Illustrator and resized to the common axial length. All diagrams were first created using 011213g0, and S and U data were updated with 011213g2, fixing the erroneous S and U data in the previous version. Visual inspection confirms that all diagrams other than those of S and U are identical between 011213g0 and 011213g2, i.e., that all diagrams from 011213g0 remained unchanged except those of S and U.

3.5 HATCHES/FLASK-AQ

The files of EQ3/6 format data bundled with HATCHES are combined into a single file in which some aux species with the improper keyword "basis" were corrected. This file is converted to a FLASK-AQ input file using the in-house software AIST TDBCONVERT. FLASK-AQ creates the intermediate file from which EhpHdraw draws an Eh-pH diagram on the X window system. This diagram is captured to an X window dump file using "xwd", and then converted to a BMP file with ImageMagic. This BMP file is used as a template for Illustrator and resized to the common axial length.

Organic species are expressed stoichiometrically in terms of the ligand species. Note that this method differs from the case of SUPCRT/FLASK-AQ. However, this difference does not affect the Eh-pH diagrams because ligand species are not included in the X-H-O system.

3.6 OECD/NEA

The tables listing the Standard Gibbs Free Energy of formation for the elements in the OECD-NEA Chemical Thermodynamics vol. 1-4 are entered into a spread sheet and saved as a text file and converted into FLASK-AQ format using in-house software. FLASK-AQ creates the intermediate file from which EhpHdraw draws the Eh-pH diagram in the X window system. This Eh-pH diagram is captured to an X window dump file using "xwd", and then converted into a BMP file with ImageMagic. This BMP file is used as a template for Illustrator and resized to the common axial length.

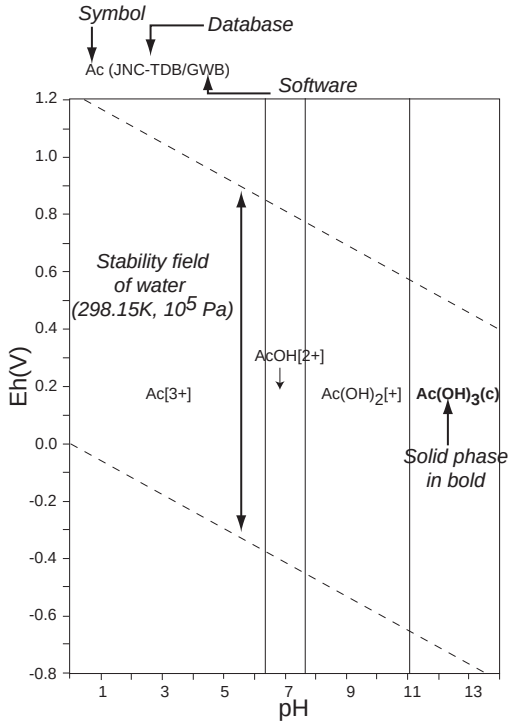

Figure 2: Legend of Eh-pH diagram

3.7 OECD-NEA update

The source database of OECD-NEA Chemical Thermodynamics vol. 5 was processed in the same way as OECD/NEA described above.

4 Explanation of the diagrams and tables

Tables and diagrams are presented in alphabetical order of the chemical symbol of the element. The tables precede the diagrams for each element. The top row of the table contains the database name. The database name and software name (both abbreviation) concatenated with a slash ("/") are found above the diagram next to the chemical symbol of the element (Figure 2). A blank column in the table and NODATA in the diagram mean either "no data for elements" or "no data for aqueous species of elements". The expression of the chemical formula used in the table and diagram is the same as in the source database, namely "as is". This was done to abide by the concept of the database compilers. Consequently, it should be noted that the expression for hydration and the solid phase differs between the databases. The expression for the charge has the same style throughout, while the expression for the solid has many variants: "am" denotes amorphous, "c" or "cr" denotes crystalline, "s" or no index indicates no discrimination for amorphous or crystalline. Some solid phases are labeled with mineral names. FACT database uses "s1", "s2", "s3" notation for polymorph phases, and the present report uses the same notation for the diagram from FACT/FACTSAGE. The names of solid phases in the table and diagram are typed in bold face. The area between the two diagonal lines from the upper left to the lower right in the diagram indicates the stability field of water at 298.15 K and 10^5 Pa. The tables list chemical species whose Eh-pH diagrams can be drawn individually for the database. Certain chemical species do not appear in the diagram because they are unstable or no data is available on them. Thus, it is important to consult the table carefully when using the diagrams.

Table 1: List of softwares used

Software	Version	OS	Description
Acrobat Distiller	4.0	Windows 2000 Professional	conversion from PS to pdf
convert	5.3.8	Linux (SuSE 7.3)	conversion from xwd to bmp
EhpHdraw	1.0	Linux (SuSE 7.3)	X window software for Eh-pH drawing
FactSage	5.2	Windows 2000 Server	Eh-pH calculation and drawing
FLASK-AQ	1.1	Linux (SuSE 7.3)	Eh-pH calculation
GWB	4.0	Windows 2000 Server	Eh-pH calculation and drawing
Illustrator	8.0	Windows 2000 Professional	final drawing of Eh-pH diagrams
Intel C++ compiler	7.0	Linux (SuSE 7.3)	compiling FLASK-AQ and EhpHdraw
pdvips	5.92b p1.6	Linux (Fedra CORE 2)	conversion from dvi to PS and printing
pLaTeX	tetex 2.0.2	Linux (Fedra CORE 2)	document processing of this report
ps2epsi	5.2.1	Linux (Fedra CORE 2)	conversion from PS to epsi
StarSuite	6.0	Linux (RedHat 9.0)	writing tables of species
tdbconvert	1.0	Linux (RedHat 9.0)	database file convert
xwd	X11R6.5	Linux (SuSE 7.3)	X window dump software

5 Reliability and uncertainty

The reliability and uncertainty of diagrams depend on the following three factors. 1) Reliability of and error in the data in the databases, 2) Uncertainty of the software used for Eh-pH calculation, 3) Fidelity of the drawing. The error is not mentioned in the databases except the OECD-NEA Chemical Thermodynamics Series. The uncertainty in the commercial softwares for drawing Eh-pH diagrams is not described. The uncertainty in FLASK-AQ depends on grid size, as already mentioned. The fidelity of the drawing is confirmed within the grid size of FLASK-AQ by visual inspection. Thus, the overall error excluding errors stemming from the databases and commercial softwares are within ± 0.0025 V for Eh and ± 0.02 units for pH.

6 Description of the softwares and their execution environments

The software used for Eh-pH calculation are GTT-Technologies FactSage 5.2 and Illinois University Geochemist's Workbench 4.0 and the in-house software AIST FLASK-AQ 1.1. FactSage 5.2 and Geochemist's Workbench 4.0 are executed under a Microsoft Windows 2000 Server on a Dell PowerEdge 2600 (Xeon 2.4GHz x2 SMP with 4GB memory). FLASK-AQ 1.1 is executed under SuSE Linux 7.3 (kernel 2.4.20) on HIT PC (Pentium4 2.8 GHz with 1GB memory). FLASK-AQ 1.1 was compiled with Intel C++ 7.0 compiler and executed with batch scheduling software LSF 4.2. To obtain the Eh-pH diagrams from the intermediate file of FLASK-AQ 1.1, the in-house software AIST EhpHdraw was used. ZZ-HATCHES-15 data was converted into the FLASK-AQ format using the in-house software AIST TDBCONVERT coded by Nihon sgi. All in-house software of AIST will be released to the general public in the future.

To obtain snapshots of the Eh-pH diagram drawn by EhpHdraw, the X Window dump software "xwd" was used. To convert from the XWD to BMP format, "convert" of ImageMagic was used. These procedures were carried out under Red Hat Linux 9 or Fedra Core 2 on an IA32 PC.

Conversion from the PostScript file to the PDF file was performed with Adobe Acrobat Distiller 4.0. Trace of the template image, resizing and cosmetics of the diagrams, and outputting to the EPS file were performed using Adobe Illustrator 8.0 under Microsoft Windows 2000 Professional on an IA32 PC.

The lists of chemical species in the tables were created with Sun StarSuite 6.0 and saved as PostScript files and converted into EPS files with "ps2epsi" under Fedra Core 2 on an IA32 PC. The final draft of this report was printed out using LaTeX and "dvips", on a Laser printer under Fedra

Core 2 on an IA32 PC (Table 1).
